

Refractive Surgery Pricing

Custom Blade Free LASIK

Blade-Free or all-laser LASIK procedures are performed with state-of-the-art, FDA-approved excimer and femtosecond (computer-guided) lasers for precise, all-laser treatment.

Custom PRK

PRK is an alternative to LASIK, which uses the same highly sophisticated excimer laser to reshape the surface of the cornea.

\$2495.00

Per Eye

- + Includes 6 months post-operative visits
- + Includes enhancement procedures for 1 year at no charge
- + Includes facility fees

Visian® ICL™

Visian ICLs, or Implantable Collamer Lenses (also known as phakic IOLs) were approved by the FDA in 2005 and are alternative treatment options to LASIK or PRK eye surgery for correcting moderate to severe myopia (nearsightedness).

\$3795.00 Standard

\$4295.00 Astigmatism

Per Eye

- + Includes 6 months post-operative visits
- + Includes lens implant
- + Includes enhancement procedures for 1 year at no charge
- + Includes facility fees

KAMRA® Inlay

The Presbyopic Inlay treatment is an eye procedure that restores near and intermediate vision and frees you from the constant frustrations of reading glasses while maintaining your distance vision in both eyes.

\$4495.00

Per Eye*

- + *KAMRA® inlay only needed in one (1) eye
- + Includes 6 months post-operative visits
- + Includes corneal inlay
- + Includes facility fees

this is where you LASIK.™

You'll love LASIK. It makes life easier.

Let's be honest, nobody likes dealing with contacts or glasses day in and day out. They get itchy and scratchy, broken and misplaced. Talk about annoying.

Now just imagine if you could rid yourself of all those daily annoyances in as little as 15 minutes. With LASIK, you can. LASIK (Laser-Assisted In Situ Keratomileusis) is the most common elective vision procedure in the U.S., and one of the most popular forms of elective surgery in America.

For most patients with myopia (nearsightedness), hyperopia (farsightedness), or astigmatism, LASIK provides a permanent alternative to glasses or contacts. The procedure usually takes less than 15 minutes and recovery time is typically very rapid, often resulting in 20/20 vision or better.

Good news! LASIK is probably right for you.

If you're the type of person who hates sticking your finger in your eye or having to constantly de-smudge your lenses, there's a good chance LASIK is meant for you.

While there are some conditions that exclude certain patients, LASIK is a great option for the majority of people who meet the age and general health requirements. If we discover during your personal consultation that LASIK isn't right for you, don't sweat it.

We have plenty of alternative options, like PRK, ICLs and refractive lens-based procedures. We invite you to contact nJoy Vision to schedule a free consultation to see if LASIK is right for you.

iLASIK. It's the only way to LASIK.

Thanks to our advanced laser technology and the innovative physicians who use it, you and your eyes are in great hands with nJoy Vision.

At nJoy Vision, our physicians are among the most celebrated and respected in the country, and they use the most advanced laser technology available – the iLASIK platform, which combines the Intralase Femtosecond laser with the VISX Star S4 IR excimer laser. The iLASIK procedure is the market leader, and has been used in over 10 million procedures.

And not only do our physicians know how to handle their lasers, they know how to handle patients too. Our patient-first mindset ensures we're looking out for your best interests at every turn, not just the few minutes you're in the surgery suite.

All-Laser LASIK. Advantage to you.

If you follow our logic that a procedure with the word laser in it is better than a procedure without the word laser in it, then you understand the significance of an All-Laser LASIK procedure at nJoy Vision.

Our iLASIK platform is backed by more than a decade of technological advancement and refinement. It brings all the latest, most advanced all-laser LASIK technology together into one super LASIK procedure. In fact, it's the same technology used by the U.S. Navy and NASA.

The iLASIK procedure uses wavefront technology to create a 3-D image of the eye and its imperfections. This advanced image then guides the laser to ensure a precise, custom treatment is performed each and every time.

LASIK & PRK FAQs

nJoyVision.com // 1.855.462.6569

How do I know if I am a candidate for Lasik or PRK eye surgery?

The decision to have laser vision correction treatment depends on the results of a thorough preoperative evaluation. Every patient is unique and so are your eyes – each eye requires a careful examination with the most advanced technology. Most patients who are mildly to moderately near-sighted and mildly farsighted with or without astigmatism qualify. Other vision treatment options are offered for patients who are ineligible for Lasik. A free consultation is available to determine whether or not you are a candidate for laser vision correction.

How long do I have to keep my contact lenses out?

Prior to your consultation and surgery, soft contact lenses should be removed for 2 weeks, soft contact lenses that correct for astigmatism or rigid gas permeable lenses will need to be out longer. An initial screening can be performed prior to discontinuing contact lens wear. Your doctor will determine the specific length of time required to remove your contact lenses.

What is the difference between LASIK and PRK?

The LASIK procedure involves creating a flap and reshaping the cornea beneath the flap. The PRK procedure directly reshapes the cornea on the surface of the eye without the creation of a flap.

How long does the LASIK or PRK eye surgery procedure take?

The procedure typically takes 5-10 minutes per eye, with the actual laser treatment time lasting less than one minute per eye. Patients are usually in the surgery suite for no more than 15 minutes and at our facility for an average of 1.5 to 2 hours. Patients need to have someone drive them home following their procedure.

Is there any pain involved with LASIK or PRK eye surgery?

Prior to treatment, anesthetic drops are used to numb the eyes to keep you comfortable during the procedure. Lasik patients will feel a mild pressure sensation, but should not experience pain. After PRK, there can be slightly more discomfort, but an oral pain medication and a special contact lens will aid in your comfort. Your doctor will also prescribe post-operative medications and lubricating drops to prevent infection and keep you as comfortable as possible as you heal.

LASIK & PRK FAQs */continued*

How much time do I need to take off from work?

Following LASIK, doctors recommend taking off the day after your surgery. Occasionally it will be recommended that more time is taken – but that is usually only when you work in a high-risk environment. Some patients are comfortable and released to return to work the next day. Following PRK, the healing process is longer and you should plan on 3-5 days of recovery time. It is important that there is not a great risk of exposure to infection or injury in the days following LASIK or PRK.

Are laser vision correction procedures covered by insurance?

LASIK and PRK are considered elective procedures. Most insurance companies do not provide coverage. We accept all major credit cards and offer flexible financing options. If you have an HSA or “cafeteria plan” you may be able to pay for laser vision correction treatment with pre-tax dollars.

Visian ICL™: Seeing clearly without contacts

ICL promises freedom. *Zoom in on the details.*

Quite literally! This lens implant helps you restore your distance vision.

The Visian ICL™, also known as the Implantable Collamer® Lens, is a microscopically thin, soft lens implanted in the eye to permanently correct mild or severe nearsightedness and astigmatism. Simply put, it's a removable lens implant that is an attractive alternative to LASIK and other refractive procedures. To date more than 1,000,000 Visian ICLs™ have been implanted in patients worldwide. Are you ready to join the club?

Quick Procedure & Recovery. *ICL is growing in popularity.*

Elite athletes, celebrities, and military personnel have chosen the Visian ICL™. It's easy to see why.

Patient outcomes have been excellent, and the Visian ICL™ procedure has been refined down to a quick and comfortable process. Most procedures are completed within 20-30 minutes or less. With a minimally invasive procedure, many achieve improved vision nearly immediately.

nJoy for ICL. *Because experience matters.*

We pride ourselves in offering our patients a complete selection of vision correction procedures that can be customized to their unique needs and provide the best possible outcome.

That's why we're excited to offer the Visian ICL™ at our centers. As always, our goal is to provide patients with access to excellent care and positive results. We understand that your decision to undergo any surgical procedure requires careful consideration and planning. nJoy Vision offers you support every step of the way: before, during and after the procedure. That's patient care FOCUSED on you.

Visian ICL™ & Implants FAQs

nJoyVision.com // 1.855.462.6569

What is Visian ICL?

The Visian ICL™ (Implantable Collamer Lens) is an advanced soft-material lens composed of 100% biocompatible collagen copolymer. The Visian ICL provides not only UV protection and permanent vision correction, but also a quality of vision that is sharper, clearer, and more vivid than that what one can achieve with glasses or contacts. Additionally, unlike LASIK, the Visian ICL procedure does not permanently alter the shape of your cornea. There is no maintenance associated with the lens, and it is intended to remain in place as long as you are satisfied with your vision. If at any point your vision changes or you wish to have them removed, it can be done easily and without compromising your vision whatsoever.

What are the advantages of Visian ICL?

If you are between the ages of 21 and 45, and suffer from a mild to severe degree of nearsightedness with or without astigmatism, then you may be a candidate for this great procedure and the advantages

- + **Immediate vision improvement at all distances** – reducing or eliminating the need for glasses or contacts.
- + **High Definition Vision** – You can enjoy a new level of vision correction that's sharper, clearer, more vivid, and has greater depth and dimension.
- + **Designed to be Permanent, Yet is Removable** – One of the important advantages of the Visian ICL is that while it can permanently correct your vision, the lens can be removed and/or replaced if necessary. Also, concerns involving the cornea typically do not apply to the Visian ICL, as no natural corneal tissue is permanently removed or reshaped in any way during implantation.
- + **Short Recovery Time** – The recovery for the Visian ICL is quick, and may be as little as one day, due to the very small size of the opening required. Patients typically experience minimal discomfort, and many times go back to work the next day.
- + **UV Protection** – Long-term exposure to UV radiation can damage your eyes; and longer term or more intense exposure increases the chance of eye disorders including the development of cataracts and some retinal problems. As an added feature, the Visian ICL advanced lens material contains a UV blocker that actually prevents harmful UVA and UVB rays from entering the eye, possibly preventing the development of UV related eye disorders.
- + **Treatment Flexibility for the Future** – Your vision changes as you grow older and eventually almost everyone will need cataract surgery. An important benefit with the Visian ICL is that you have options for future treatments. Because Visian ICL maintains the structure of the eye, the lens can be removed and replaced if your vision changes substantially, or if you have another procedure at any time.
- + **Simplification of Life** – There is no daily maintenance as with traditional contact lenses, and no concern of problems from daily activities such as swimming and sports.
- + **LASIK Alternative** – Patients who have corneas too thin or prescriptions too high for LASIK can still live a life less dependent upon glasses thanks to this procedure.

Visian ICL™ & Implants FAQs */continued*

How is the procedure performed?

The Visian ICL procedure is an outpatient procedure that generally takes around 15 minutes. Prior to the procedure you will receive topical anesthesia drops to minimize discomfort. Then the doctor creates a micro opening to insert the lens into the eye with an injector. Once the lens is injected, it unfolds in the eye and the procedure is complete. Patients experience an immediate improvement in vision and are “wowed” by the results.

Who is a candidate for Visian ICL?

If you are between the ages of 21 and 45 and nearsighted, with or without astigmatism, you may be an excellent candidate for the Visian ICL. This procedure is able to treat a range of patients from low to extremely high refractive errors and is especially beneficial to those with thin corneas and dry eyes. It is preferable that the patient has not undergone any ophthalmic surgery and does not have a history of eye disease such as iritis, glaucoma, or diabetic retinopathy.

Who is NOT a candidate for Visian ICL?

At nJoy Vision, we always recommend you undergo a vision consultation to determine the best vision correction plan for you. If the Visian ICL is not right for you, other options are available.

Is the Visian ICL FDA approved?

Yes. The Visian ICL received approval from the FDA for a wide range of myopic (nearsightedness) correction needs, with and without astigmatism.

What is the track record of the Visian ICL?

Extensive research and development preceded the introduction of the Visian ICL. It is now being used by more than 500,000 patients worldwide. The satisfaction rate among patients is extremely high – above 99%. The Visian ICL provides unparalleled quality of vision and has excellent and stable outcomes for patients with mild to severe myopia. The Visian ICL has been available internationally for over 20 years.

Is the Visian ICL visible to others?

No. The Visian ICL is positioned behind the iris (the colored part of the eye), where it is invisible to both you and observers.
